Scala in Practice

lab 02

Acceptance criteria:

Create Scala program with:

- Package *numbers* which contains class representing rational numbers:
  - **class** Rational(. . .) {

    . . .
    def +(other: Rational): Rational = ??? *// addition*
    def -(other: Rational): Rational = ??? *// subtraction*
    def *(other: Rational): Rational = ??? *// multiplication*
    def /(other: Rational): Rational = ??? *// division*
    }
  - Validate arguments of constructors with *require*[1] precondition
  - *toString* should return the reduced fraction (for example: Rational(50, 6).*toString => "8 1/3"*)
  - Create the *companion objec*t with factory methods for numbers: 0 & 1 & *apply* with default denominator = 1

- Package *figures* which contains:
  - Classes to model *triangle*, *rectangle* & *square* in Euclidean space, all defined on vertices being instances of **class** Point(x: Rational, y: Rational). Having functions:
    - **def** area: Double = ???
    - **val** description: String = ??? *//"Triangle", "Rectangle" or "Square"*
  - Propose couple *auxiliary constructors* or *companion objects* with functions which could ease usage of these classes

- Create *singleton* object with functions:
  - **def** areaSum(figures: List[...]): Double = ??? *//Sum all areas*
  - **def** printAll(figures: List[...]): Unit = ??? *//Print all descriptions*

- Create *application entry-point* object with some example tests for the above implementation
